

Features

Designed for a better quality of life

The design of new buildings will be informed by a new set of guidelines designed to ensure future development is sustainable and in harmony with AlUla's landscape and beauty, and feature characteristics such as:

1. Climatic comfort & sustainability

Main openings are oriented toward the courtyards or smaller open spaces providing natural lighting and natural ventilation options for all the rooms reducing the need for lighting and air conditioning.

2. Privacy & safety designs

Designs allow the opportunity to create a distinctive private open space with rooftop terraces, courtyards, and patios to relax and entertain.

3. Smart design

The combination of innovative design practices and traditional building techniques will allow for more comfortable and efficient homes to be built, such as through the reduced need for air conditioning.
